

Redesign the Misleading Colored Chart

R.No: 30 Reg. No: 192524110 Name: Pranayaa S

Each chart below uses color in a misleading or confusing way. For each one, answer the three questions in your own words.

Chart 1

1. What is this chart trying to show?

It shows how many survey respondents are at each skill level: Advanced (~98) and Beginner (~93) are the largest groups, Expert has ~71 and Intermediate only ~12.

2. What's wrong with the color choice?

The levels have a natural order (Beginner to Expert) but each gets a random, unrelated colour (yellow, purple, orange, blue), so colour shows no progression; bright yellow grabs attention and has low contrast.

3. Propose a better color scheme (describe it in words):

Use one hue from light to dark: very light blue for Beginner, darker shades for Intermediate and Advanced, dark navy for Expert, so darkness matches skill level (also colour-blind and print friendly).

Chart 2

1. What is this chart trying to show?

It shows the Air Quality Index for each month from Jan to Sep: worst in Jan (~395) and May (~365), cleanest in Feb (~32), and moderate mid-year (Jun ~207, Aug ~145).

2. What's wrong with the color choice?

The rainbow scale runs backwards: red marks the lowest (cleanest) AQI while the most polluted months are a calm purple; rainbow hues have no natural order and red/green confuse colour-blind viewers.

3. Propose a better color scheme (describe it in words):

Use one sequential scale where darker means worse air (pale yellow, orange, dark red, maroon), or the Indian AQI bands: green Good, yellow Moderate, orange Poor, red Very Poor, maroon Severe.

Redesign the Misleading Colored Chart — Set 30

Name: Pranayaa S Roll No: 30 Reg No: 192524110 Slot D

What is each chart trying to show, what is wrong with its colours, and how would I fix them?

Chart 1: Survey Response – Response Counts (bar chart)

What it shows: How many respondents fall into each skill level. Advanced (about 98) and Beginner (about 93) are the largest groups, Expert follows with about 71, and Intermediate is far smaller at about 12.

What's wrong with the colours: The four levels are in a natural order, from Beginner up to Expert, but each bar gets an unrelated colour: yellow, purple, orange and blue. Nothing in the colours suggests a progression, so the reader can't tell from colour that Expert sits above Advanced. The bright yellow Beginner bar grabs attention for no reason and has poor contrast on white. Yellow and orange also look alike, hinting that Beginner and Advanced are related when they sit at opposite ends.

Better colour scheme: One sequential hue that gets darker as skill rises: very light blue for Beginner, medium-light blue for Intermediate, medium-dark blue for Advanced and dark navy for Expert. Darkness then matches the order of the levels at a glance, and it stays readable for colour-blind viewers and in grayscale. A single neutral colour for every bar would also work, since the axis already names each level.

Chart 2: Air Quality Index by Month (bar chart with rainbow scale)

What it shows: The Air Quality Index month by month from January to September. Air was worst in January (about 395) and May (about 365), cleanest in February (about 32), and moderate in months such as June (about 207) and August (about 145). A higher AQI means more polluted air.

What's wrong with the colours: The rainbow scale runs backwards to what people expect. Red marks the lowest AQI, so February, the cleanest month, looks like a danger warning, while the worst months are a calm purple. Rainbow colours have no natural order, so readers can't tell whether cyan or green means worse air without checking the legend. Bright yellow and cyan bands create sharp jumps between similar values, red and green are hard to separate for colour-blind viewers, and the colour only repeats what bar height already shows.

Better colour scheme: A single sequential scale where darker and warmer means worse air: pale yellow for low AQI, through orange, to dark red and maroon for the highest values, so February is the palest bar and January and May the darkest. Even better, colour bars by the Indian AQI bands readers already know: dark green Good (0–50), light green Satisfactory (51–100), yellow Moderate (101–200), orange Poor (201–300), red Very Poor (301–400) and maroon Severe (401–500).
